

Defense – Ball Pursuit and Retrieval

Pre-contact phase

Defense is a <u>reaction skill</u> and the players often need to chase a ball that was deflected by another player or that was played in an area of the court that wasn't covered by anyone.

- 1. The defender needs to be in a <u>ready position</u> that will allow them to play both the <u>high hit</u> (B) and the <u>low hit</u> (A). The knees have to be <u>bent in a comfortable position</u> and the weight is on the front of the feet.
 - It is that position that will allow the player to **quickly start chasing** the ball.
- 2. The defender is **looking at the hitter and reads the play**.
- 3. The defender identifies the trajectory of the ball and <u>initiates</u> movement with first step in the direction of the ball. If the ball is deflected behind them, they open their body by taking a first step backwards with the foot closest to the ball.
- 4. The defender chases the ball by <u>taking quick steps</u> towards it. While moving, the center of gravity either <u>lowers</u> (**D**) or <u>raises</u> (**C**) depending on the trajectory of the ball that has to be dug.

Contact phase

- 6. The most important factor in retrieving the ball is **the angle of the platform**. Just before contact, the defender must position their body in a way that will allow them to **orient their platform towards the middle of the court**. That might mean jump (**B**), dive with one hand (**D**) or fall to the floor (**E**).
- 7. The <u>eyes are on the ball</u> and arms are oriented towards the middle of the court. The shoulder further away from the court is <u>slightly</u> <u>lifted and wraps around the ball at contact.</u> (B, C)

Post-contact phase

- 7. The follow through is <u>oriented towards the middle of the court</u> as much as possible.
- 8. The player either <u>rolls or dives</u> to avoid injuries during the fall and to be back on their feet quickly for the next action.
